

Insert a ball-end 2mm hex key or similar blunt object in the location shown and manually depress the valve manual override. Replace the cover screw and warning label when finished.

- Signals are sourced from the Control/Signal Module via the internal pin block. See Electrical Schematic on Sheet 4 for details.
- The valve mounting access holes are to be used only in a valve replacement situation. A 3mm hex key is to be used to loosen the cone point set screws that retain the valve. Care should be taken to avoid striking the internal valve disconnect during the valve removal process.

Pneumatic Circuit Notes:

- Dual solenoid valve type shown. The valve is shown in the Latched State, solenoid de-energized. Dual solenoid position is determined by the solenoid energized and the previous state upon loss of power.

 The valve will NOT operate correctly if insufficient air pressure is supplied. It is critical that the exhaust muffler is not restricted. As part of a preventative
- maintenance program, periodically inspect and/or replace the exhaust muffler.
